Problems

1. Visualizing differences across sites in major taxon abundance

a. Plan your figure

- x-axis: site
- y-axis: ostracod abundance
- geometry to represent average abundance/L: `geom_jitter`
- geometry to represent medians: `stat_summary()`

b. Wrangle your data

```
# create new object from aq_ins_clean
ost_cod_abundance <- aq_ins_clean |>
  # filter to only ostracods
  filter(taxon == "ostracod") |>
  # remove missing abundance/L values
  filter(!is.na(ave_lit)) |>
  # group by site
  group_by(site_full) |>
  # combines all abundance values for each site
  summarize(
    ave_lit = sum(ave_lit, na.rm = TRUE)) |>
  # ungroup dataframe
  ungroup()

slice_sample(ost_cod_abundance, n = 10)
```

```
# A tibble: 7 x 2
  site_full      ave_lit
  <fct>         <dbl>
1 Phelps Road    1200.
2 Devereux Creek   79.6
3 South of Venoco Bridge  3.33
4 South of Phelps Bridge 975.
5 North of Venoco Bridge  4.93
6 North of Phelps Bridge  2.53
7 Main Channel    2.93
```

c. Code your figure

d. Create a multipanel figure

e. Interpret your figure

differences between sites in copepod and ostracod abundance how ostracod abundance may relate (or not) to site-level differences in salinity

2. Visualizing total abundance as a function of salinity

a. Plan your figure

x-axis: y-axis: color: geometry: facets:

b. Wrangle your data

c. Code your figure

d. Interpret your figure

In 3-5 sentences, describe differences or similarities between taxa in relationships between abundance and salinity. Be specific using the visual components of the plot.
